

Bms equalizes battery voltage

Overview

Passive cell balancing occurs when a cell's voltage exceeds a certain threshold, and the BMS activates a resistor to dissipate the excess energy. A battery management system (BMS) is a device that monitors and controls the charging and discharging of a battery pack. There are two ways that a BMS can equalize battery voltages: Active. Accurately measuring voltage is one of the most important jobs of a Battery Management System (BMS). It helps prevent overcharging, detects imbalances between cells, and supports key functions like State of Charge (SoC) and State of Health (SoH) estimation. It also accommodates any adjustments needed for optimal battery usage.

Learn how BMS improves battery performance by equalizing charge across cells in electric vehicle battery systems.

- LiFePO₄ Battery, safety**
- Wide temperature: -20~55°C**
- Modular design, easy to expand**
- The heating function is optional**
- Intelligent BMS**
- Cycle Life: > 6000**
- Warranty: 10 years**
