

Do microgrids need to be connected to the Internet

Overview

A microgrid is a self-contained electrical network that allows you to generate your own electricity on-site and use it when you need it most. 2 A microgrid can operate in either grid-connected or in island mode, including entirely off-grid. Microgrids are essentially small, smart power systems that are self-sufficient and are able to supply a specific area. These areas can include a business complex, a neighborhood, a school or university or even a hospital grouping. [2][3] Microgrids may be linked as a cluster or operated as stand-alone or isolated microgrid which only operates off-the-grid not be connected to a wider electric power system.
