

How to bond photovoltaic panels to electric poles

Overview

Solar panels are secured to a pole by using brackets, screws, or nails. This process can be done with the help of hand tools such as a screwdriver and hammer. This process involves two distinct but related concepts: system grounding, which connects current-carrying conductors to the earth for voltage stabilization, and equipment grounding, which bonds all metallic components to prevent shock hazards. It is a mandatory practice required by NEC and IEC codes to protect both equipment and personnel from damage and electric shock hazards. We will cover the specific engineering, hardware. Whereas all electrical equipment is required to be grounded, per 250.
