

# How to deal with PID failure of solar inverter

## Overview

---

While PID can pose significant challenges, there are effective solutions to address it. Use of PID Resistant Panels: Opting for panels with built-in PID resistance can prevent degradation. In case you are dealing with unexpected and unreasonable power loss in your photovoltaic plant, you may be experiencing the PID effect in the PV modules. Potential induced degradation (PID) is a phenomenon that arises over time (months or even years). Some module manufacturers are already working to develop countermeasures by using new. Potential Induced Degradation (PID) is a performance-degrading phenomenon in photovoltaic (PV) modules, where voltage potential differences between the solar cell and the frame or grounded components cause leakage currents, resulting in a significant reduction in power output over time. Solis inverters may display "PID Repairing" on the screen when first turned on or during operation. This issue is typically related to the DSP (Digital Signal Processor) and occurs if the DSP firmware is missing or corrupted, or if the DSP board is.
