

# How to ground the inverter of photovoltaic power station

## Overview

---

Solar inverters can be grounded by using a grounding rod made of copper. It is better to have an electric panel connected to a single ground point. In this scenario, the equipment grounding conductor (EGC) of the PV circuit can be connected to the grounding terminal of the inverter, which is eventually connected to the AC grounding system. Put in two ground rods outside the shed at least 6ft apart and connect to those What if the inverter is in a caravan?

You'll want to ground. Yet, grounding is often misunderstood, with common errors leading to system failures and safety hazards. With the onset of high photovoltaic (PV) penetration, more utility companies are starting to look at PV plants the same way they would look at other major generators.
