

Incremental distribution network energy storage power station

Overview

As the best “test field” for the implementation and development of “source network load storage integration”, the Incremental Distribution Network (IDN) is an effective form of load aggregation resources and an indispensable main carrier for building a new power system. This paper first enumerates the concept, development status and scheduling mode of a distributed new-energy storage system. Based on the above, it establishes a new-energy power generation model and an energy storage system charging and discharging model, and proposes a global optimization. To this end, this article introduces the virtual player “Nature” to realize the combination of the game theory and robust optimization and proposes an incremental distribution network source-load-storage collaborate planning method with a multi-agent game. In particular, the former involves network planning with the consideration of a long-term multi-stage study horizon, as. At the same time, investors can also use the new energy energy storage station and in the park to cope with the fluctuations of market real-time electricity prices.
