

Inverter Microgrid Research

Overview

Abstract—This paper investigates microgrid transient stability with mixed generation—synchronous generator (SG), grid-forming (GFM) and grid-following (GFL) inverters— under increasing penetration levels toward a 100% renewable generation microgrid. Strategy I: All battery inverters work in GFM mode with power sharing by droop control (50% GFM inverters). Based on the study, select the more appropriate control strategy for the microgrid. Specifically, the dynamics of a microgrid with an. Although droop control and VSG control each have distinct benefits, neither can fully meet the diverse, dynamic needs of both grid-connected (GC) and islanded (IS) modes. Our researchers evaluate in-house-developed controls and partner-developed microgrid components using software modeling and hardware-in-the-loop evaluation platforms.
