

Seychelles energy storage economics

Overview

The levelised cost of energy (LCOE) for solar-plus-storage on islands fell below \$0.10/kWh in 2024, undercutting diesel generation at \$0.10/kWh. Lithium-iron-phosphate (LFP) batteries now dominate because of safety and cycle life (>6000 cycles). The Seychelles has long faced challenges in its journey towards renewable energy, primarily due to limited land availability, suboptimal wind resources, and its reliance on Heavy Fuel Oil and diesel. This dependency has resulted in some of the highest electricity tariffs in the world, placing. For islands the typical architecture includes utility-scale solar and wind farms, battery energy storage systems (BESS), microgrids for individual islands or districts, and advanced metering infrastructure (AMI). Solar Farm Integration New photovoltaic arrays will double solar generation capacity to 50 MW, requiring smart energy storage solutions to manage intermittent production. With tourism contributing over 25% of GDP.
