

Will solar power generation be useful in the end times

Overview

If solar continues its current 5-year compound growth rate of 23%, then by the end of 2046, it could be supplying all our global energy demand at 2023 levels. By 2050, we could more than double our energy consumption globally and solar will still be generating more than we. In our latest Short-Term Energy Outlook (STEO), we expect U. electricity generation will grow by 1.6% in 2027, when it reaches an annual total of 4,423 BkWh. The three main dispatchable sources of electricity generation (natural gas, coal, and nuclear) accounted for 75% of. Can we do anything useful with excess solar and wind energy, besides store it?

Yes: we could use it to power flexible activities at different times of day, or to send electricity further afield — as long as the grid allows it. Engagement with solar energy may not only enhance survival prospects but also promote ecological stewardship during tumultuous periods, written through. The past few years have seen a frankly astounding acceleration in the rate of its deployment, with total generation capacity doubling between 2022 and 2024 to supply a full 7 per cent of the world's electricity. The transition from fossil fuels to cleaner, renewable sources of energy is not just a matter of technological innovation but also of global.
