

Wind and solar power generation forms

Overview

In this interactive chart, we see the share of primary energy consumption that came from renewable technologies - the combination of hydropower, solar, wind, geothermal, wave, tidal, and modern biofuels. In our latest Short-Term Energy Outlook, we forecast that wind and solar energy will lead growth in U.S. power generation for the next two years. solar power generation will grow 75% from 163 billion kilowatthours. Electric power generation is the process of producing electricity from other forms of energy - be it the mechanical energy of a moving turbine, the heat from burning fuel, sunlight captured by a photovoltaic panel, or another source. Traditional biomass - which can be an important energy source in lower-income settings is not. If you invest in renewable energy for your home such as solar, wind, geothermal, fuel cells or battery storage technology, you may qualify for an annual residential clean energy tax credit.

How much of our electricity comes from renewables?
In the sections above we looked at the role of renewables in the total energy mix. This includes not only electricity but also transport and heating. Electricity forms only one component of energy consumption. Since transport and heating tend to be harder to decarbonize - they are more reliant on oil and gas - r... See more on our world in data
