## Overview

---

Wind turbines use blades to collect the wind's kinetic energy. The blades are connected to a drive shaft that turns an electric generator, which produces (generates). Wind power or wind energy is a form of renewable energy that harnesses the power of the wind to generate electricity. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. When consulting with renewable energy enthusiasts about their wind power setups, one requirement kept coming up: reliable, high-efficiency turbines that can handle varying wind conditions without constant fuss.
